Description

Wired in-line with the equipment to be protected, these units offer continuous voltage measurements and will disconnect the power when the voltage falls outside specified limits. Automatic re-connection takes place after a predetermined delay. The EVT40 are intended for use inside OEM equipment such as air conditioners and motor panels. The EVT40R has a random timing delay programmed in it to allow multiple units to be used on a single phase supply.

Features:

- Performs Cycle - by - cycle RMS voltage measurements
- Provides protection against:

Over voltage

Under voltage

- Based on AVR technology
- Enclosed in a convenient screw-mounted enclosure

Code: 12-00286
